Other	Rapid-Cal™ self calibration to assure linear response. Quant-View™ mode for readout in units of electrons. BERT™ Background Event Reduction™ technology to eliminate speckles. Black-lock™ and Top-Lock™ technology Vari-Bit™ technology for matching bit-depth to application needs. Active Clocking Enhancement™ for precise transfer of charge. Photometrics Active Regulation™ for precise and stable EM gain control. Bias stability control. Lowest fixed-pattern noise in the industry. Lifetime vacuum seal. EM overload protection. Integrated lens cap.	Stabilized gain and bias for accurate quantitation. Electron-multiplying CCD technology AND low-noise standard read-out port.	Photometrics introduces the Evolve™ 128 EMCCD camera. The Evolve 128 delivers the highest frame rates available with extreme sensitivity for demanding low-light applications ranging from In Vivo imaging to Single Molecule Fluorescence. As the leader in quantitative performance, the Evolve 128 provides researchers an enhanced imaging tool with on board camera intelligence. Features such as Quant-View™ combined with superior stability, enables precise and accurate research measurement and reproducible results.	Premier camera for low-light, high-precision fluorescence microscopy. Flexible and durable enough to handle almost all advanced quantitative microscopy applications.	1 rs = rolling shutter / gs = global shutter. 2 ssc = slow scan mode - 16 bit / fsc = fast scan mode. Visually lossless compression / decompression for data transfer in fsc and horizontal resolution greater than 1920 pixel (due to Camera Link limitations). 3 The readout noise values are given as root mean square (rms) and median (med) values, due to the different noise models, which can be used for evaluation. 4 The dark current in global shutter mode consists of an exposure time related part and of a sensor readout time related part, which is constant for a given pixelclock 0.6 e <sup>-</sup> @ 286 MHz / 1.8 e <sup>-</sup> @ 95.3 MHz and frame size (here full frame). A smaller ROI reduces the latter part of the dark current accordingly. 5 The high dynamic signal is simultaneously converted at high and low gain by two 11 bit A/D converters and the two 11 bit values are sophisticatedly merged into one 16 bit value.	The new pco.pixelfly usb is a high performance digital 14 bit CCD camera system specially designed for low light applications in the spectral range of visible light if a small form factor is required.	Ideal camera for labs needing a quantitative camera for most low- to moderate-light applications.	Fanless design for Atomic Force Microscopy applications. Precision camera for moderate light levels.	Low-cost precision camera for moderate light levels. Small pixels are excellent for low-magnification microscopy.	Runs on PVCAM driver only. Electron-multiplying CCD technology AND low-noise standard read-out port.	Supports RGB Filter Modules. High-speed FireWire-B interface.	Supports RGB Filter Modules. Blackout mode turns off all camera lights.
