An excellent two-color detector composed of silicon and lead sulfide photodiodes, available in two different cooling levels, provides broad spectral response from the UV to near-IR.

These dual color single point detectors detect signals across a broad wavelength range, with a dual layered photodiode design using silicon on top of indium gallium arsenide. The silicon photodiode is transparent to wavelengths above 1000 nm allowing the InGaAs to detect those longer NIR wavelengths. With high sensitivity ( $D^*$ ) and two options for ambient and thermoelectric cooling, responsivity extends from 200 nm to 2600 nm. This is one of a number of dual color single point solid state detectors available from HORIBA Scientific. Contact us for further information.

Used in conjunction with optically optimized housings, these detectors integrate seamlessly with HORIBA's extensive selection of monochromators. In addition, the SpectrAcq2 acquisition module allows for software integration with LabSpec, SynerJY, or LabVIEW. With all of the additional Optical Building Blocks available from HORIBA, a user can easily go from individual components to a complete spectroscopy solution.
